

## **JED 2017 served as a catalyst to inspire, empower and connect dental technicians**

March 9, 2017 (North Haven, Conn.) - On Feb. 24, 2017 nearly 200 dental laboratory owners and technicians filled Jensen Dental's Education Day lecture hall at the Swissôtel in Chicago and an additional 200 technicians and laboratory owners joined remotely via the streaming Live webcast. Now in its 23<sup>rd</sup> year, Jensen celebrated its annual education day 23 in Chicago with a unique education format.

Don Cornell, Sang Jun and James Choi worked together to assemble a unique program that was specifically focused on three different product categories - traditionally layered, minimally layered and monolithic. How labs use these processes every day in their laboratories and how they are processing those restoration types, when they use them, where they use them, how they use them, and why you choose one over the other in specific cases. Included in the program was a dentist, Dr. Brian Vence.

It was a very fascinating learning experience for everybody including the instructors, as the program culminated with all three of the instructors working on exactly the same case. Working with a single patient, the four-unit anterior case was restored using traditionally, minimally layered and monolithic techniques. In addition, at the conclusion of the individual lectures there was a panel discussion that all four presenters participated in while fielding questions with the participants.
